

Ten First Screens

A full second pass after review. Same question — what greets you on Day 84? — same live numbers (154.5 lb, 33 days to goal, -1.4 this week), completely new proposals tuned to the critique.

KILLED

Verdict-first ("On track.") · serif editorial · calorie-budget hero · coach-first screen · brutalist mono · short low charts

AMPLIFIED

Tall charts zoomed so marginal variation is center stage · week views ×3 · background imagery behind data · goal geometry · honest uncertainty

CONSTANTS

154.5 leads everywhere — no judgment words · full-bleed, no cards · coach stays silent unless needed

01 Slope — The immersion, sharpened

03 This Week II — Seven days, full volume

05 Altitude — The descent, mapped

07 The Cone — An honest future

09 Tide — The night shift

02 Ridgeline — The chart lives in a landscape

04 Steps — The staircase

06 Pace Line — Progress as geometry

08 One Number, One Curve — Minimal — but the data leads

10 Continuous Zoom — One chart, every horizon

BASELINE SCREEN SHOWN AT RIGHT FOR REFERENCE · ALL MOCKUPS AT 390×844

FIG. 00

THE BASELINE — WHAT SHIPS TODAY

FIG. 01

SLOPE

Slope

The immersion, sharpened

THE IDEA

The full-bleed chart from pass one, rebuilt so the data can't hide: the y-axis is zoomed to the 30-day range, the curve owns three quarters of the screen, and gridlines every 2 lb make a 0.3 lb morning visible from across the room.

WHY IT'S INTERESTING

- Marginal variation is the point — at this zoom, daily noise has texture and the trend is undeniable.
- No chrome at all: weight, dates and the goal flag live inside the chart's own margins.
- The projection ends in a planted flag at 150, not a fading dashed line.

PROGRESSIVE DISCLOSURE & INTERACTIONS

- Hold + drag scrubs any day; the hero number swaps to that day's value.
- Pinch zooms the y-axis around today's weight.
- Swipe switches 7D / 30D / 90D windows — axis re-fits every time.

SHOWN — weight, avg, week delta, zoomed curve, projection, goal flag. HIDDEN — kcal math, totals.

FIG. 02

RIDGELINE

Ridgeline

The chart lives in a landscape

THE IDEA

A full-bleed valley scene — mist, descending ridges — with your curve drawn across the sky where the fog is clearing. The area under the line dissolves into the valley below; the goal is a flag planted on the far ridge.

WHY IT'S INTERESTING

- Background imagery gives the screen a mood without costing a pixel of data.
- The landscape descends as you do — the scene itself is the progress bar.
- Most screenshot-able version on the table, and 154.5 still reads first.

PROGRESSIVE DISCLOSURE & INTERACTIONS

- Tap the scene to strip it back to the plain chart (focus mode).
- Drag across the ridge to scrub any day.
- The palette follows your actual weigh-in hour — dawn, noon, dusk.

SHOWN — weight, week delta, curve, day letters, goal flag. HIDDEN — everything else.

FIG. 03

THIS WEEK II

This Week II

Seven days, full volume

THE IDEA

Pass one's week view with the volume turned up: the axis is zoomed to the week's 2.9 lb span so each morning is a visible event, bars carry a dotted drift line, and the only hero is the week's delta stated as data.

WHY IT'S INTERESTING

- At this zoom, +0.2 and -0.4 are legible — marginal variation is center stage.
- Nothing about August exists here; long-term pressure lives one gesture away.
- The drift line over the bars quietly teaches: steps down, noise up.

PROGRESSIVE DISCLOSURE & INTERACTIONS

- Swipe right to rewind week by week — the hero recomputes per week.
- Pull down and the chart stretches into the 30-day view.
- Tap a bar for that day's note and weigh-in time.

SHOWN — 7 days, week delta, today's weight. HIDDEN — goal, pace, totals.

FIG. 04

STEPS

Steps

The staircase

THE IDEA

Same week, different honesty: a step chart, because you weigh in once a day — the data really is seven flat readings, not a curve. Drawn as a tall descending staircase on warm paper, today's step in signal orange.

WHY IT'S INTERESTING

- Step charts are the truthful geometry for sampled data — no fake interpolation between mornings.
- The staircase metaphor is instant: down is winning, and you can count the steps.
- Architecturally bold — geometric and playful, nothing like a finance app.

PROGRESSIVE DISCLOSURE & INTERACTIONS

- Same gestures as This Week II — swipe for history, pull to grow.
- Tap a tread for that day's detail.
- Risers tint on up-days, so a rough week reads at a glance.

SHOWN — 7 daily readings as steps, week delta. HIDDEN — everything long-term.

FIG. 05

ALTITUDE

Altitude

The descent, mapped

THE IDEA

The whole cut as a topographic elevation profile: you started at 168.6 and you're descending toward sea level at 150. Your marker sits on the slope at 154.5 — the largest label on screen — with the remaining route dashed to the flag.

WHY IT'S INTERESTING

- Fixes the journey problem outright: where you are IS the hero, pinned to the terrain.
- "4.5 lb to go" feels like a walk, not a debt.
- Contour lines and a dawn horizon make it a poster, not a dashboard.

PROGRESSIVE DISCLOSURE & INTERACTIONS

- Drag along the route to revisit any day's elevation.
- Tap the flag to re-plan — the terrain re-slopes around the new goal.
- The sky warms as you approach sea level.

SHOWN — full profile, current weight, lb descended / to go, goal flag. HIDDEN — kcal, projections.

Pace Line

Progress as geometry

THE IDEA

No adjectives, just two lines: the plan (168.6 → 150 by Aug 21) and what you actually did. The gap between them is tinted — right now it's a four-day-ahead gap — and today's readout compares plan vs actual: 155.3 called, 154.5 weighed.

WHY IT'S INTERESTING

- "Ahead" becomes something you see, not something the app tells you — zero value judgment.
- The plan line is a commitment device rendered as a ruler.
- Works at any zoom; the tinted gap grows and shrinks with you.

PROGRESSIVE DISCLOSURE & INTERACTIONS

- Drag the plan line's endpoint to re-commit — date and target re-solve.
- Tap the gap to toggle "days ahead" ↔ "lb ahead".
- Pinch to zoom into the near-term segment.

SHOWN — plan line, actual curve, gap, plan-vs-actual today. HIDDEN — everything else.

FIG. 06

PACE LINE

FIG. 07

THE CONE

The Cone

An honest future

THE IDEA

The dashed projection lies — it pretends to know the path. This replaces it with a probability cone that widens into the future: center landing 148.8, likely band 148.6–149.0, arriving around Aug 18. The past is solid; the future is a fan.

WHY IT'S INTERESTING

- Uncertainty rendered honestly is calming — plateaus stop feeling like broken promises.
- The fan is a distinctive, beautiful shape no competitor has.
- Still lands on the goal flag, so the story stays intact.

PROGRESSIVE DISCLOSURE & INTERACTIONS

- Drag the cone's edge wider or narrower to stress-test your assumed rate.
- Tap the band for the underlying 14-day rate math.
- Watch the cone re-shape each morning with one new point.

SHOWN — history, cone, landing band, goal line. HIDDEN — raw kcal estimates.

○ #ffffff ● #1f6bff ● #c9d9fb

FIG. 08

ONE NUMBER, ONE CURVE

One Number, One Curve

Minimal — but the data leads

THE IDEA

The minimal option done without verdicts: one giant number, one tall zoomed curve filling the rest of the screen, and a single context line under the number that cycles on tap. That is the entire interface.

WHY IT'S INTERESTING

- Progressive disclosure without ever hiding the curve — context rotates, the trend is permanent.
- No judgment words anywhere; the curve speaks for itself.
- One tap replaces one dashboard — the fastest possible read.

PROGRESSIVE DISCLOSURE & INTERACTIONS

- Tap the context line to cycle: AVG → WEEK → PROJ → DAYS LEFT.
- Long-press the curve to scrub any day.
- Double-tap swaps lb ↔ kg.

SHOWN — weight, one rotating context stat, tall curve. HIDDEN — everything, one tap at a time.

○ #ffffff ● #111111 ● #d9432f

FIG. 09

TIDE

Tide

The night shift

THE IDEA

The dark-room version: a deep aurora sky, a glassy white curve glowing over it, day letters like constellations. Same data, same zoom — but the screen feels like weather at 11pm.

WHY IT'S INTERESTING

- Weigh-ins and check-ins happen in low light; this is native to that moment.
- The aurora's intensity drifts with your streak — ambient, never loud.
- Proof the data-first layout survives a completely different skin.

PROGRESSIVE DISCLOSURE & INTERACTIONS

- Tap anywhere to lift the aurora into plain dark mode.
- Drag the curve to scrub any day.
- The sky can follow local weather if you let it.

SHOWN — weight, week delta, glowing curve, day letters. HIDDEN — the rest.

● #060b1a ● #7ee0c2 ● #b18cff

FIG. 10

CONTINUOUS ZOOM

Continuous Zoom

One chart, every horizon

THE IDEA

This Week and Chart Immersion are the same idea at different scales — so make the scale fluid. Pinch the curve and it flows from 7 days to 30 to the whole cut, re-fitting the y-axis live so variation always fills the screen. A small slider shows where in time you are.

WHY IT'S INTERESTING

- Kills the window-picker (7D / 30D / ALL) — time becomes a physical dimension.
- At every zoom level the axis re-fits, so marginal variation is always center stage.
- The most direct answer to “show less, then let me go deeper”.

PROGRESSIVE DISCLOSURE & INTERACTIONS

- Pinch to travel through time scales; the slider follows your fingers.
- Double-tap snaps to the three canonical stops: week, month, cut.
- Flick the slider to jump straight to goal day.

SHOWN — curve at current zoom, weight, scale slider. HIDDEN — everything until pinched into view.
